

ABSTRACT:

This invention combines an appointment reminder with a novel calendar period.

The portion of the normal calendar printed would always start with the month or week in which businesses distribute them to customers. The total period shown by the calendar will be one week to one month more than the period generally recommended for repetition of the service provided and will vary with the type of business giving them to customers.

Space would be provided for printing of the contact and other data of such companies and for notation of the date and time of the next appointment. Space could also be provided for advertisements by other businesses. Magnetic devices could be adhesively attached to the material on which such novel calendar and appointment reminder was imprinted to enable removable attachment thereof to items containing ferrous materials.
